

New Video Compare

How we're automating our QA checks

March 2026

The Problem

TIME SINK

Manual video checks are the slowest part of our work.

FATIGUE

It's easy to miss micro-glitches when checking files all day.

ROUTINE

70% of our time goes to file handling instead of real QA work.

What we're building

Auto-fetching

System picks up files from Cradle automatically.

Automated Checks

Checks video and audio including VO.

Knowledge Base

A growing Knowledge Base of QA decisions to train autonomous approval agents.

Scaling up

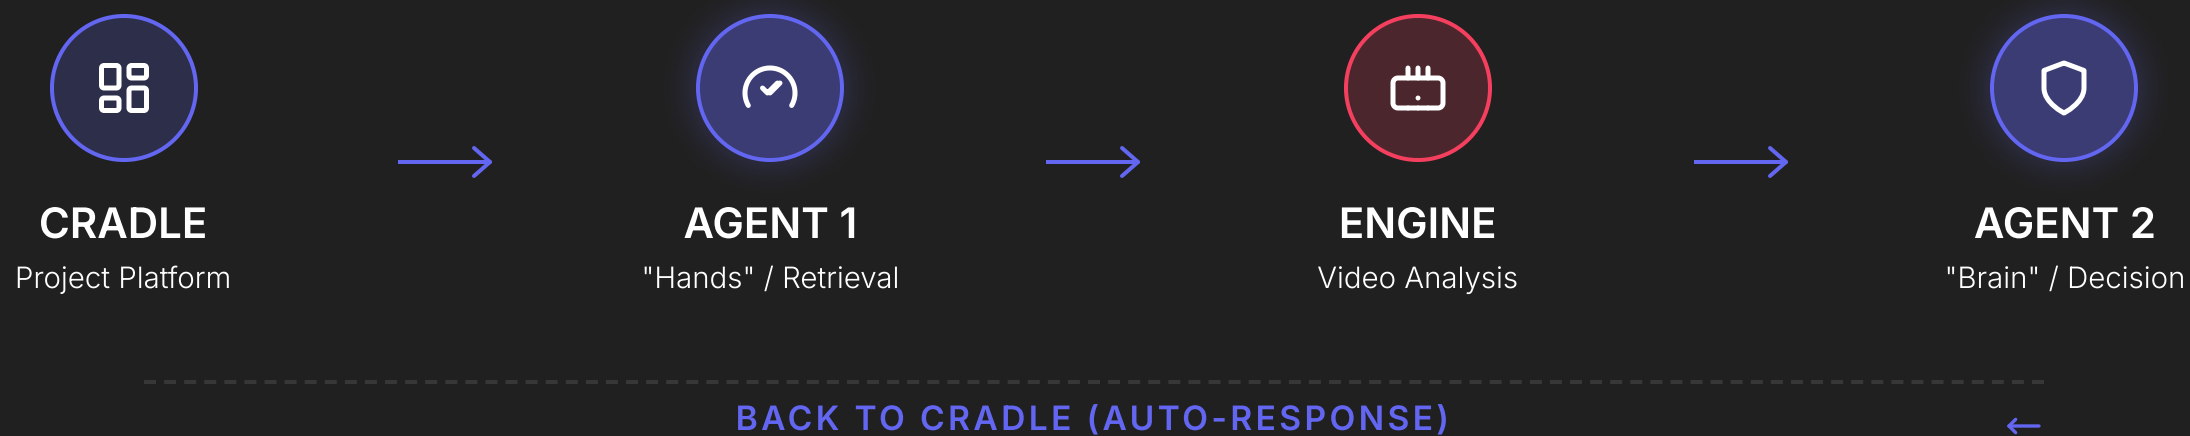

One of us can oversee multiple project checks at once.

System Architecture

Operational Status: Human-in-the-loop automation (Agent 1 & 2 active, supporting final QA judgment).

- 1. Agent 1 (The Hands):** Monitors tasks and fetches brand files automatically.
- 2. Agent 2 (The Brain):** Compares videos and flags differences for us to review.
- 3. The Engineer:** Last stage in the rather distant future.

How files move

What's ready now

- ✓ **Visual Heatmaps**: Seeing exactly where frames differ.
- ✓ **Auto-Fetcher**: No more manual downloading from Cradle.
- ✓ **Decision Registry**: Every decision we make helps the system learn.

Next Steps

- Auto-commenting on Cradle tasks based on comparison results.
- Full dashboard for team-wide project tracking.
- Integration with global cloud infrastructure for infinite parallel processing.
- Need API or LLM capability for full system automation.
